

Information কী?

☞ সহজভাবে:

Information হলো এমন কিছু যা uncertainty (অনিশ্চয়তা) কমায় .

Communication System-এর দৃষ্টিতে

☞ Information হলো:

Source থেকে প্রেরিত meaningful message যা receiver-এর কাছে নতুন knowledge দেয়

Entropy কী?

একটি source থেকে আসা uncertainty-এর পরিমাপ |

দুটি random variable (X এবং Y) একসাথে কতটা uncertainty তৈরি করে — তার measure

☞ অর্থাৎ:

- X + Y একসাথে consider করলে total randomness কত

✓ Formula

$$H(X, Y) = - \sum \sum P(x, y) \log_2 P(x, y)$$

👉 এখানে:

- $P(x, y)$ = joint probability

2. Conditional Entropy $H(Y|X)$

কী এটা?

X জানা থাকলে Y-এর uncertainty কত থাকে

☞ অর্থাৎ:

- X জানার পর Y সম্পর্কে কতটা অনিশ্চয়তা বাকি

 Formula

$$H(Y|X) = - \sum \sum P(x, y) \log_2 P(y|x)$$

Relative Entropy!

Relative entropy is a measure of the distance between two probability distributions P and Q .

Relative entropy is also known as Kullback-Leibler (KL) Divergence.

Relative entropy, also known as Kullback-Leibler divergence, is a measure of the distance between two distributions.

The relative entropy $D(P||Q)$ is a measure of the inefficiency of assuming that the distribution is Q when the true distribution is P .

The relative entropy between two probability mass functions $P(x)$ and $Q(x)$ is defined as

$$D(P||Q) = \sum_{x \in X} P(x) \log_2 \frac{P(x)}{Q(x)}$$

$$= E_P \log \frac{P(x)}{Q(x)}$$

Properties of Relative Entropy:

$$D(P||Q) \geq 0$$

Relative entropy is always greater than or equal to zero. It is zero if and only if $P=Q$ everywhere.

Asymmetry:

$D_{KL}(P||Q) \neq D_{KL}(Q||P)$
 KL divergence is not symmetry, so it does not satisfy.
 The property of a true distance metric.

Mutual Information:

एक random variable द्वारा प्राप्त जानकारी को दूसरे random variable द्वारा प्राप्त जानकारी से मापा जाता है।

Mutual Information:

Mutual Information is a measure of the amount of information that one random variable contains about another random variable. It is reduction in the uncertainty of one random variable due to the knowledge of the other.

Consider two random variable x and y with joint probability mass function $p(x, y)$ and marginal probability mass functions $p(x)$ and $p(y)$. The mutual information $I(x, y)$ is the relative entropy between the joint distribution and product distribution $p(x)p(y)$:

Thus, the mutual information of a random variable with itself is the entropy of the random variable. This is the reason that entropy is sometimes ~~not~~ referred to as self-information.

Fig 1: Relationship between entropy and mutual information.

Redundancy: Extra bit ~~first~~ ~~not~~

Important Equation in one frame:

Entropy:

$$H(x) = - \sum_{x \in X} P(x) \log_2 P(x)$$

Joint Entropy:

$$H(x, y) = - \sum_{x \in X} \sum_{y \in Y} P(x, y) \log_2 P(x, y)$$

Conditional Entropy:

$$H(y|x) = - \sum_{x \in X} \sum_{y \in Y} P(x, y) \log_2 (y|x)$$

$H(y|x)$ = এটা বস্তু x এর জন্য y এর অনিশ্চয়তা
কতটা অনিশ্চয়তা বস্তু x এর জন্য

Mutual Information:

$$I(x; y) = \sum_{x \in X} \sum_{y \in Y} P(x, y) \log_2 \frac{P(x, y)}{P(x) P(y)}$$

Relative Entropy:

$$D(P||Q) = \sum_{x \in X} P(x) \log_2 \frac{P(x)}{Q(x)}$$

$$P(x, y) = P(x) P(y|x)$$

$$= P(y) P(x|y)$$

Relationship between Joint & conditional Entropy:

$$H(x, y) = H(x) + H(y|x)$$

or

$$H(x, y) = H(y) + H(x|y)$$
